(54) Title: 6-ALKENYL-, 6-ALKINYL- AND 6-EPOXY-EPOTHILONE DERIVATIVES, PROCESS FOR THEIR PRODUCTION, AND THEIR USE IN PHARMACEUTICAL PREPARATIONS

(57) Abstract

This invention describes the new 6-alkenyl- and 6-alkinyl- epothilone derivatives of general formula (I) in which R^{1a} , R^{1b} , R^{2a} , R^{3a} , R^{3b} , R^4 , R^5 , R^6 , R^7 , A, Y, D, E, G, Y and Z have the meanings that are indicated in the description. The new compounds interact with tubulin by stabilizing microtubuli that are formed. They are able to influence the cell-splitting in a phase-specific manner and thus find use in treating diseases or conditions associated with the need for cell growth, division and/or proliferation. Thus the compounds are suitable for treating malignant tumors, for example, ovarian, stomach, colon, adeno-, breast, lung, head and neck carcinomas, malignant melanoma, acute lymphocytic and myelocytic leukemia. In addition, they are suitable for anti-angiogenesis therapy as well as for treatment of chronic inflammatory diseases (such as psoriasis, arthritis). Methods of use and preparation of the compounds are also described.

6-Alkenyl-, 6-Alkynyl- and 6-Epoxy-Epothilone Derivatives,
Process for their Production, and their Use in Pharmaceutical
Preparations

Background of the Invention

Höfle et al. describe the cytotoxic action of the natural substances epothilone A (R = hydrogen) and epothilone B (R = methyl) of the following formula:

in, e.g., Angew. Chem. [Applied Chem.], 1996, 108, 1671-1673.

Because of their in-vitro selectivity for breast cell lines and intestinal cell lines and their significantly higher activity against P-glycoprotein-forming multiresistant tumor lines in comparison to taxol as well as their physical properties that are superior to those of taxol, e.g., a water solubility that is higher by a factor of 30, this novel structural class is especially advantageous for the development of a pharmaceutical agent for treating malignant tumors.

The natural substances are not sufficiently stable either chemically or metabolically for the development of pharmaceutical agents. To eliminate these drawbacks, modifications to the natural substance are necessary. Such modifications are possible only with a total-synthesis approach and require synthesis strategies that make possible a broad modification of the natural substance. The purpose of the structural changes is also to increase the therapeutic range. This can be done by improving the selectivity of the action and/or increasing the active strength and/or reducing undesirable toxic side-effects, as they are described in Proc. Natl. Acad. Sci. USA 1998, 95, 9642-9647.

The total synthesis of epothilone A is described by Schinzer et al. in Chem. Eur. J. 1996, 2, No. 11, 1477-1482 and in Angew. Chem. 1997, 109, No. 5, pp. 543-544). Epothilone derivatives were already described by Höfle et al. in WO 97/19086. These derivatives were produced starting from natural epothilone A or B. Also, epothilones C and D (double bond between carbon atoms 12 and 13: epothilone C = deoxyepothilone A; epothilone D = deoxyepothilone B) are described as possible starting products for this purpose.

Another synthesis of epothilone and epothilone derivatives was described by Nicolaou et al. in Angew. Chem. 1997, 109, No. 1/2, pp. 170-172. The synthesis of epothilone A and B and

several epothilone analogues was described in Nature, Vol. 387, 1997, pp. 268-272; and the synthesis of epothilone A and its derivatives was described in J. Am. Chem. Soc., Vol. 119, No. 34, 1997, pp. 7960-7973 as well as the synthesis of epothilone A and B and several epothilone analogues in J. Am. Chem. Soc., Vol. 119, No. 34, 1997, pp. 7974-7991 also by Nicolaou et al.

Nicolaou et al. also describe in Angew. Chem. 1997, 109, No. 19, pp. 2181-2187 the production of epothilone A analogues using combinative solid-phase synthesis. Several epothilone B analogues are also described there.

Epothilone derivatives, in some cases also epothilone C and D, are also described in patent applications WO 99/07692, WO 99/02514, WO 99/01124, WO 99/67252, WO 98/25929, WO 97/19086, WO 98/38192, WO 99/22461 and WO 99/58534.

In the epothilone derivatives previously known, no alkenyl, alkynyl or epoxy radical was provided on carbon atom 6 (see the above formula) of the epothilone skeleton.

Summary of the Invention

An object of this invention was to make available new epothilone derivatives, which are both chemically and metabolically stable enough for the development of pharmaceutical agents and which are superior to natural derivatives in terms of

their therapeutic range, their selectivity of action and/or undesirable toxic side-effects and/or their active strength.

Production of Partial Fragments A₂:

The partial fragments (synthesis components) of general formula A-1 can be produced starting from the precursors described in WO 99/07692, such as, for example, A-I. This is further explained by way of example in Diagram 1.

Diagram 1

Step a (A-I → A-II):

The hydroxyl group that is protected by PG^7 in A-1 is released. As protective group PG^7 , the protective groups

described above and that are known to one skilled in the art, such as, e.g., the methoxymethyl, methoxyethyl, ethoxyethyl, tetrahydropyranyl, tetrahydrofuranyl, trimethylsilyl, triethylsilyl, tert-butyldimethylsilyl, tert-butyldiphenylsilyl, tribenzylsilyl, triisopropylsilyl, benzyl, para-nitrobenzyl, para-methoxybenzyl, formyl, acetyl, propionyl, isopropionyl, pivalyl, butyryl or benzoyl radicals, are suitable. A survey is found in, e.g., "Protective Groups in Organic Synthesis," Theodora W. Green, John Wiley and Sons).

Preferred are those protective groups that can be cleaved under the action of fluoride, such as, e.g., the trimethylsilyl, tert-butyldimethylsilyl, tert-butyldiphenylsilyl, tribenzylsilyl, or triisopropylsilyl radical.

Especially preferred are the tert-butyldimethylsilyl radical, the triisopropylsilyl radical, and the tert-butyldiphenylsilyl radical.

As protective groups PG^{aa} and PG^{ab} , the groups that are already mentioned for PG' and together a $-CR^{2aa}R^{2ab}$ group, in which R^{2aa} and R^{2ab} can be the same or different and mean hydrogen, C_1 - C_{10} alkyl, aryl, C_1 - C_{10} aralkyl, are suitable.

Preferred are those $-CR^{2aa}R^{2ab}$ protective groups, in which R^{2aa} and R^{2ab} mean C_1 - C_6 alkyl, or R^{2aa} means hydrogen and R^{2ab} means aryl.

Especially preferred is a $-C(CH_3)_2$ group.

Protective group PG' is cleaved according to a process that is known to one skilled in the art. This is a silyl ether, thus suitable for the cleavage is the reaction with fluorides, such as, for example, tetrabutylammonium fluoride, hydrogen fluoride-pyridine complex, potassium fluoride or the use of dilute mineral acids, the use of catalytic amounts of acids, such as, e.g., para-toluenesulfonic acid, para-toluenesulfonic acid-pyridinium salt, camphorsulfonic acid in alcoholic solutions, preferably in ethanol or isopropanol.

Step b (A-II \rightarrow A-III):

The oxidation of the primary alcohol in A-II to aldehyde A-III is carried out according to the methods that are known to one skilled in the art. For example, oxidation with pyridinium chlorochromate, pyridinium dichromate, chromium trioxide-pyridine complex, oxidation according to Swern or related methods, e.g., with use of oxalyl chloride in dimethyl sulfoxide, the use of Dess-Martin periodinane, the use of nitrogen oxides, such as, e.g., N-methyl-morpholino-N-oxide in the presence of suitable catalysts, such as, e.g., tetrapropylammonium perruthenate in inert solvents, can be mentioned. Preferred is the oxidation

according to Swern, as well as with N-methyl-morpholino-N-oxide using tetrapropylammonium perruthenate.

Step c (A-III → A-IV):

The reaction of aldehydes A-III to alcohols of formula A-IV is carried out with organometallic compounds of theoretical formula $M-CHR_2R^{2a'}$, in which M stands for indium, an alkali metal, preferably lithium or a divalent metal MX, in which X represents a halogen, and radical $R^{2a'}$ has the above-mentioned meanings. As a divalent metal, magnesium and zinc are preferred; as halogen, X is preferably chlorine, bromine and iodine.

Step d (A-IV → A-V):

The oxidation of the secondary alcohol in A-IV to ketone A-V is carried out according to the conditions that are mentioned under step b). Preferred is the oxidation with N-methyl-morpholino-N-oxide with use of tetrapropylammonium perruthenate.

Step e (A-V → A-VI):

For optional introduction of a radical $R^{2b'}$, which, except for hydrogen, can have the already mentioned meanings, the ketone of general formula A-V is converted into the enolate with M in

the meaning of the counter-cation with use of strong bases, such as preferably lithium diisopropylamide.

Step f (A-VI - A-VII):

The enolate of formula A-VI is reacted with a compound of general formula $X-R^{2b'}$, in which X represents a halogen or another leaving group, such as, for example, an alkylsulfonate or arylsulfonate. As halogen, X is preferably chlorine, bromide and iodine.

The partial fragments (synthesis components) of general formula A-2 can be produced by known methods, such as described in Angew. Chemie 1996, 108, 2976-2978. Another process is shown in Diagram 2:

Diagram 2

Step a (A-VIII - A-IX).

The oxidation of the primary alcohol in A-VIII to aldehyde A-IX is carried out according to the methods that are described for Diagram 1, step b. The oxidation according to Swern and with N-methyl-morpholino-N-oxide with use of tetrapropylammonium perruthenate is preferred.

Step b (A-IX - A-X):

The carbonyl group in A-IX can optionally be converted into a ketal according to the methods that are known to one skilled in the art.

Introduction of the Nitrogen Group for R^{29} :

Amino group NHR^{29} can be introduced in the stage of the C_x -fragment, the BC-fragment or the ABC-fragment according to the methods that are known to one skilled in the art. Preferred is the production from the azide ($R^{29} = \text{N}_3$), which is first converted into the phosphazide according to the methods that are known to one skilled in the art, preferably with use of a phosphine such as, for example, triphenylphosphine; the phosphazide is then converted in the presence of water into the amine ($R^{29} = \text{NHR}^{29}$) that is optionally to be protected for the further course of reaction. The introduction of the azide can be carried out with use of the Mitsunobu reaction in the presence of metal azides, preferably sodium or tin azide or by substitution of a suitable

leaving group, such as, for example, a chlorine, bromine or iodine atom, an alkylsulfonyloxy group, a perfluorinated alkylsulfonyloxy group, an arylsulfonyloxy group or an aralkylsulfonyloxy group by azides.

The flexible functionalization of described components A₂, B₂ and C₂ also ensures a linkage sequence that deviates from the above-described process and that leads to components ABC. These processes are listed in the following table:

The invention also relates to all prodrug formulations of these compounds, i.e., all compounds that release in vivo a bioactive active ingredient component of general formula I.

Biological Actions and Applications of the New Derivatives:

The new compounds of formula I are valuable pharmaceutical agents. They interact with tubulin by stabilizing microtubuli that are formed and are thus able to influence the cell-splitting in a phase-specific manner. Accordingly, the compounds find use in treating diseases or conditions associated with cell growth, division and/or proliferation. They have particular application with quick-growing, neoplastic cells, whose growth is largely unaffected by intercellular regulating mechanisms. Active ingredients having properties of this type, including the compounds of this invention, are suitable for treating malignant tumors. As applications, there can be mentioned, for example, the therapy of ovarian, stomach, colon, adeno-, breast, lung, head and neck carcinomas, malignant melanoma, acute lymphocytic and myelocytic leukemia, particularly against tumors associated therewith. The compounds according to the invention are additionally suitable owing to their properties for anti-angiogenesis therapy as well as for treatment of chronic inflammatory diseases, such as, for example, psoriasis, multipl

sclerosis or arthritis. The compounds of the invention have utilities analogous to those for known epothilone derivatives, discussed above, but with the advantages discussed above and below. As with the known epothilones, the new compounds can be administered for and in a manner analogous to known drugs such as Taxol, but modified to take advantage of their particular superior properties thereover.

In other embodiments, to avoid uncontrolled proliferation of cells and/or for better compatibility of medical implants, the new compounds or pharmaceutical formulations containing them can be applied or introduced into the polymer materials that are used for these purposes.

The invention also relates to pharmaceutical agents that are based on pharmaceutically compatible compounds, i.e., compounds of general formula I that are nontoxic in the doses used, optionally together with commonly used adjuvants and vehicles.

In other embodiments, the compounds according to the invention can be encapsulated with liposomes or included in an α -, β - or γ -cyclodextrin clathrate.

According to methods of galenicals that are known in the art, the compounds according to the invention can be processed into pharmaceutical preparations for enteral, percutaneous,

PCT/IB 00/00657

Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:
Although claims 21 and 22 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.
2. ☐ Claims Nos.:
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this International application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
